

EECS 3221: OPERATING SYSTEM FUNDAMENTALS

Hamzeh Khazaei

Department of Electrical Engineering and
Computer Science

Week 2, Module 2:
Processes

Assignment Project Exam Help

January 11, 2021

Operating System Concepts – 10th Edition

3.1

Silberschatz et al © 2018 updated by Khazaei @ 2021

1

<https://powcoder.com>

Add WeChat powcoder

-
- Process Concept
 - Process Scheduling
 - Operations on Processes
 - Interprocess Communication
 - IPC in Shared-Memory Systems
 - IPC in Message-Passing Systems
 - Examples of IPC Systems
 - Communication in Client-Server Systems

Operating System Concepts – 10th Edition

3.2

Silberschatz et al © 2018 updated by Khazaei @ 2021

2

Process Concept

- An operating system executes a variety of programs that run as a process.
- **Process** – a program in execution; process execution must progress in sequential fashion
- Multiple parts
 - The program code, also called **text section**
 - Current activity including **program counter**, processor registers
 - **Stack** containing temporary data
 - ▶ Function parameters, return addresses, local variables
 - **Data section** containing global variables
 - **Heap** containing memory dynamically allocated during run time

Assignment Project Exam Help

Operating System Concepts – 10th Edition

3.3

Silberschatz et al © 2018 updated by Khazaei @ 2021

3

<https://powcoder.com>

Add WeChat powcoder Process Concept (cont.)

- Program is **passive** entity stored on disk (**executable file**); process is **active**
 - Program becomes process when executable file loaded into memory
- Execution of program started via GUI mouse clicks, command line entry of its name, etc
- One program can be several processes
 - Consider multiple users executing the same program

Operating System Concepts – 10th Edition

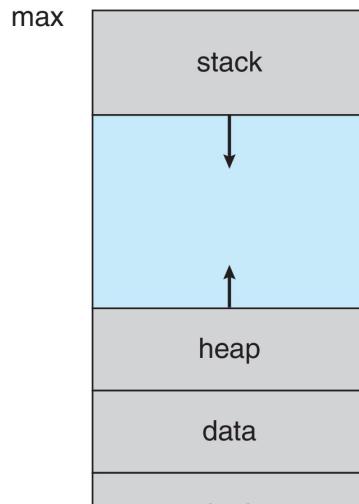

3.4

Silberschatz et al © 2018 updated by Khazaei @ 2021

4

Add WeChat powcoder

Operating System Concepts – 10th Edition

3.6

Silberschatz et al © 2018 updated by Khazaei @ 2021

6

Process State

- As a process executes, it changes **state**
 - **New:** The process is being created
 - **Running:** Instructions are being executed
 - **Waiting:** The process is waiting for some event to occur
 - **Ready:** The process is waiting to be assigned to a processor
 - **Terminated:** The process has finished execution

Assignment Project Exam Help

7

<https://powcoder.com>

Add WeChat powcoder Diagram of Process State

Operating System Concepts – 10th Edition

3.8

Silberschatz et al © 2018 updated by Khazaei @ 2021

8

Process Control Block (PCB)

Information associated with each process

(also called **task control block**)

- Process state – running, waiting, etc
- Program counter – location of instruction to next execute
- CPU registers – contents of all process-centric registers
- CPU scheduling information- priorities, scheduling queue pointers
- Memory-management information – memory allocated to the process
- Accounting information – CPU used, clock time elapsed since start, time limits
- I/O status information – I/O devices allocated to process, list of open files

Assignment Project Exam Help

<https://powcoder.com>

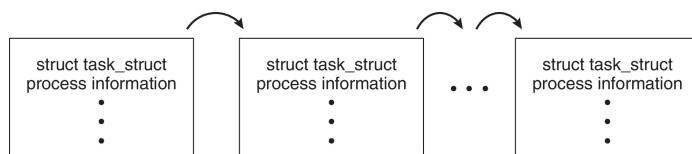

Add WeChat Threads powcoder

- So far, process has a single thread of execution
- Consider having multiple program counters per process
 - Multiple locations can execute at once
 - ▶ Multiple threads of control -> **threads**
- Must then have storage for thread details, multiple program counters in PCB
- Explore in detail in Chapter 4

Process Representation in Linux (PCB)

Represented by the C structure `task_struct`

```
pid t_pid;           /* process identifier */  
long state;          /* state of the process */  
unsigned int time_slice /* scheduling information */  
struct task_struct *parent; /* this process's parent */  
struct list_head children; /* this process's children */  
struct files_struct *files; /* list of open files */  
struct mm_struct *mm;      /* address space of this process */  
...  
...
```

Assignment Project Exam Help

Operating System Concepts – 10th Edition

3.11

Silberschatz et al © 2018 updated by Khazaei @ 2021

11

<https://powcoder.com>

Add WeChat powcoder

- Maximize CPU use, quickly switch processes onto CPU core
- **Process scheduler** selects among available processes for next execution on CPU core
- Maintains **scheduling queues** of processes
 - **Ready queue** – set of all processes residing in main memory, ready and waiting to execute
 - **Wait queues** – set of processes waiting for an event (i.e. I/O)
 - Processes migrate among the various queues

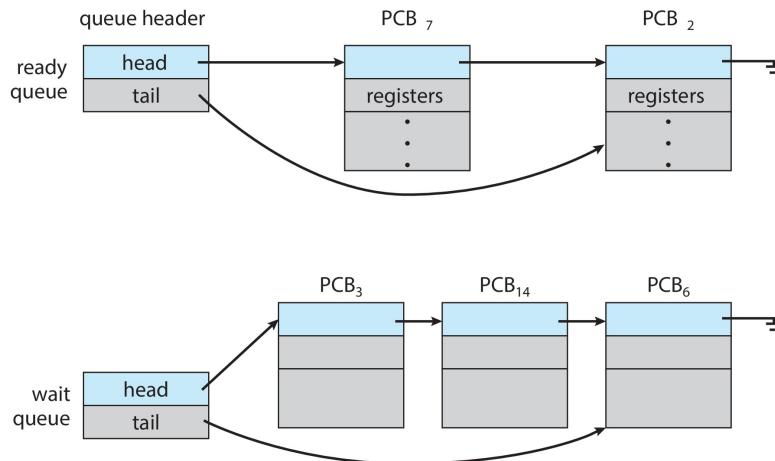

Operating System Concepts – 10th Edition

14

CPU Switch From Process to Process

A **context switch** occurs when the CPU switches from one process to another.

Assignment Project Exam Help

Operating System Concepts – 10th Edition

3.15

Silberschatz et al © 2018 updated by Khazaei @ 2021

15

<https://powcoder.com>

Add WeChat powcoder

- When CPU switches to another process, the system must **save the state** of the old process and load the **saved state** for the new process via a **context switch**
- **Context** of a process represented in the PCB
- Context-switch time is overhead; the system does no useful work while switching
 - The more complex the OS and the PCB → the longer the context switch
- Time dependent on hardware support
 - Some hardware provides multiple sets of registers per CPU → multiple contexts loaded at once

Operating System Concepts – 10th Edition

3.16

Silberschatz et al © 2018 updated by Khazaei @ 2021

16

Multitasking in Mobile Systems

- Some mobile systems (e.g., early version of iOS) allow only one process to run, others suspended
- Due to screen real estate, user interface limits iOS provides for a
 - Single **foreground** process- controlled via user interface
 - Multiple **background** processes– in memory, running, but not on the display, and with limits
 - Limits include single, short task, receiving notification of events, specific long-running tasks like audio playback
- Android runs foreground and background, with fewer limits
 - Background process uses a **service** to perform tasks
 - Service can keep running even if background process is suspended
 - Service has no user interface, small memory use

3.17

Silberschatz et al © 2018 updated by Khazaei @ 2021

17

<https://powcoder.com>

Add WeChat powcoder Operations on Processes

- System must provide mechanisms for:
 - process creation
 - process termination

Operating System Concepts – 10th Edition

3.18

Silberschatz et al © 2018 updated by Khazaei @ 2021

18

Process Creation

- Parent process create children processes, which, in turn create other processes, forming a tree of processes
- Generally, process identified and managed via a process identifier (pid)
- Resource sharing options
 - Parent and children share all resources
 - Children share subset of parent's resources
 - Parent and child share no resources
- Execution options
 - Parent and children execute concurrently
 - Parent waits until children terminate

A Tree of Processes in Linux

Operating System Concepts – 10th Edition

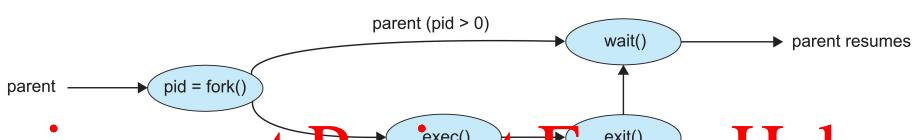

3.20

Silberschatz et al © 2018 updated by Khazaei @ 2021

20

Process Creation (Cont.)

- Address space
 - Child duplicate of parent
 - Child has a program loaded into it
- UNIX examples
 - `fork()` system call creates new process
 - `exec()` system call used after a `fork()` to replace the process' memory space with a new program
 - Parent process calls `wait()` for the child to terminate

21

<https://powcoder.com>

C Program Forking Separate Process

```
#include <sys/types.h>
#include <stdio.h>
#include <unistd.h>

int main()
{
    pid_t pid;

    /* fork a child process */
    pid = fork();

    if (pid < 0) { /* error occurred */
        fprintf(stderr, "Fork Failed");
        return 1;
    }
    else if (pid == 0) { /* child process */
        execlp("/bin/ls", "ls", NULL);
    }
    else { /* parent process */
        /* parent will wait for the child to complete */
        wait(NULL);
        printf("Child Complete");
    }
}

return 0;
}
```

Operating System Concepts – 10th Edition

3.22

Silberschatz et al © 2018 updated by Khazaei @ 2021

22

Creating a Separate Process via Windows API

```
#include <stdio.h>
#include <windows.h>

int main(VOID)
{
    STARTUPINFO si;
    PROCESS_INFORMATION pi;

    /* allocate memory */
    ZeroMemory(&si, sizeof(si));
    si.cb = sizeof(si);
    ZeroMemory(&pi, sizeof(pi));

    /* create child process */
    if (!CreateProcess(NULL, /* use command line */
                      "C:\\WINDOWS\\system32\\mspaint.exe", /* command */
                      NULL, /* don't inherit process handle */
                      NULL, /* don't inherit thread handle */
                      FALSE, /* disable handle inheritance */
                      0, /* no creation flags */
                      NULL, /* use parent's environment block */
                      NULL, /* use parent's existing directory */
                      &si,
                      &pi))
    {
        fprintf(stderr, "Create Process Failed");
        return -1;
    }
    /* parent will wait for the child to complete */
    WaitForSingleObject(pi.hProcess, INFINITE);
    printf("Child Complete");

    /* close handles */
    CloseHandle(pi.hProcess);
    CloseHandle(pi.hThread);
}
```

Assignment Project Exam Help

23

<https://powcoder.com>

Add WeChat powcoder

- Process executes last statement and then asks the operating system to delete it using the **exit()** system call.
 - Returns status data from child to parent (via **wait()**)
 - Process' resources are deallocated by operating system
- Parent may terminate the execution of children processes using the **abort()** system call. Some reasons for doing so:
 - Child has exceeded allocated resources
 - Task assigned to child is no longer required
 - The parent is exiting, and the operating systems does not allow a child to continue if its parent terminates

Operating System Concepts – 10th Edition

3.24

Silberschatz et al © 2018 updated by Khazaei @ 2021

24

Process Termination

- Some operating systems do not allow child to exists if its parent has terminated. If a process terminates, then all its children must also be terminated.
 - **cascading termination.** All children, grandchildren, etc. are terminated.
 - The termination is initiated by the operating system.
- The parent process may wait for termination of a child process by using the `wait()` system call. The call returns status information and the pid of the terminated process

```
pid t pid;
int status; ...
pid = wait(&status);
```

- If no parent waiting (did not invoke `wait()`) process is a **zombie**

- If parent terminated without invoking `wait()` process is an **orphan**

28

14

Multiprocess Architecture – Chrome Browser

- Many web browsers ran as single process (some still do)
 - If one web site causes trouble, entire browser can hang or crash
- Google Chrome Browser is multiprocess with 3 different types of processes:
 - **Browser** process manages user interface, disk and network I/O
 - **Renderer** process renders web pages, deals with HTML, Javascript. A new renderer created for each website opened
 - ▶ Runs in **sandbox** restricting disk and network I/O, minimizing effect of security exploits
 - **Plug-in** process for each type of plug-in

29

<https://powcoder.com>

Add WeChat powcoder Interprocess Communication

- Processes within a system may be **independent** or **cooperating**
- Cooperating process can affect or be affected by other processes, including sharing data
- Reasons for cooperating processes:
 - Information sharing
 - Computation speedup
 - Modularity
 - Convenience
- Cooperating processes need **interprocess communication (IPC)**
- Two models of IPC
 - **Shared memory**
 - **Message passing**

31

<https://powcoder.com>

Add WeChat powcoder Producer-Consumer Problem

- Paradigm for cooperating processes, *producer* process produces information that is consumed by a *consumer* process
 - **unbounded-buffer** places no practical limit on the size of the buffer
 - **bounded-buffer** assumes that there is a fixed buffer size

Operating System Concepts – 10th Edition

3.32

Silberschatz et al © 2018 updated by Khazaei @ 2021

32

Interprocess Communication – Shared Memory

- An area of memory shared among the processes that wish to communicate
- The communication is under the control of the user processes not the operating system.
- Major issues is to provide mechanism that will allow the user processes to synchronize their actions when they access shared memory.
- Synchronization is discussed in great details in Chapters 6 & 7.

3.33

Silberschatz et al © 2018 updated by Khazaei @ 2021

33

<https://powcoder.com>

Bounded Buffer Shared Memory Solution

- Shared data

```
#define BUFFER_SIZE 10
typedef struct {
    ...
} item;

item buffer[BUFFER_SIZE];
int in = 0;
int out = 0;
```

- Solution is correct, but can only use **BUFFER_SIZE-1** elements

Operating System Concepts – 10th Edition

3.34

Silberschatz et al © 2018 updated by Khazaei @ 2021

34

```
item next_produced;

while (true) {
    /* produce an item in next produced */
    while (((in + 1) % BUFFER_SIZE) == out)
        ; /* do nothing */
    buffer[in] = next_produced;
    in = (in + 1) % BUFFER_SIZE;
}
```

while (true) {
    while (in == out)
        ; /* do nothing */
    next_consumed = buffer[out];
    out = (out + 1) % BUFFER_SIZE;

    /* consume the item in next consumed */
}
```

Operating System Concepts – 10th Edition

3.36

Silberschatz et al © 2018 updated by Khazaei @ 2021

36

Interprocess Communication – Message Passing

- Mechanism for processes to communicate and to synchronize their actions
- Message system – processes communicate with each other without resorting to shared variables
- IPC facility provides two operations:
 - `send(message)`
 - `receive(message)`
- The *message* size is either fixed or variable

Assignment Project Exam Help

Operating System Concepts – 10th Edition

3.37

Silberschatz et al © 2018 updated by Khazaei @ 2021

37

<https://powcoder.com>

Add WeChat powcoder Message Passing(Cont.)

- If processes *P* and *Q* wish to communicate, they need to:
 - Establish a **communication link** between them
 - Exchange messages via send/receive
- Implementation issues:
 - How are links established?
 - Can a link be associated with more than two processes?
 - How many links can there be between every pair of communicating processes?
 - What is the capacity of a link?
 - Is the size of a message that the link can accommodate fixed or variable?
 - Is a link unidirectional or bi-directional?

Operating System Concepts – 10th Edition

3.38

Silberschatz et al © 2018 updated by Khazaei @ 2021

38

Message Passing (Cont.)

- Implementation of communication link
 - Physical:
 - Shared memory
 - Hardware bus
 - Network
 - Logical:
 - Direct or indirect
 - Synchronous or asynchronous
 - Automatic or explicit buffering

Assignment Project Exam Help

Operating System Concepts – 10th Edition

3.39

Silberschatz et al © 2018 updated by Khazaei @ 2021

39

<https://powcoder.com>

Add WeChat powcoder Direct Communication

- Processes must name each other explicitly:
 - `send(P, message)` – send a message to process P
 - `receive(Q, message)` – receive a message from process Q
- Properties of communication link
 - Links are established automatically
 - A link is associated with exactly one pair of communicating processes
 - Between each pair there exists exactly one link
 - The link may be unidirectional, but is usually bi-directional

Operating System Concepts – 10th Edition

3.40

Silberschatz et al © 2018 updated by Khazaei @ 2021

40

Indirect Communication

- Messages are directed and received from mailboxes (also referred to as ports)
 - Each mailbox has a unique id
 - Processes can communicate only if they share a mailbox
- Properties of communication link
 - Link established only if processes share a common mailbox
 - A link may be associated with many processes
 - Each pair of processes may share several communication links
 - Link may be unidirectional or bi-directional

Assignment Project Exam Help

Operating System Concepts – 10th Edition

3.41

Silberschatz et al © 2018 updated by Khazaei @ 2021

41

<https://powcoder.com>

Add WeChat powcoder

Indirect Communication

- Operations
 - create a new mailbox (port)
 - send and receive messages through mailbox
 - destroy a mailbox
- Primitives are defined as:
 - `send(A, message)` – send a message to mailbox A
 - `receive(A, message)` – receive a message from mailbox A

Operating System Concepts – 10th Edition

3.42

Silberschatz et al © 2018 updated by Khazaei @ 2021

42

Indirect Communication

- Mailbox sharing
 - P_1 , P_2 , and P_3 share mailbox A
 - P_1 , sends; P_2 and P_3 receive
 - Who gets the message?
- Solutions
 - Allow a link to be associated with at most two processes
 - Allow only one process at a time to execute a receive operation
 - Allow the system to select arbitrarily the receiver. Sender is notified who the receiver was.

Assignment Project Exam Help

Operating System Concepts – 10th Edition

3.43

Silberschatz et al © 2018 updated by Khazaei @ 2021

43

<https://powcoder.com>

Add WeChat powcoder

- Message passing may be either blocking or non-blocking
- **Blocking** is considered **synchronous**
 - **Blocking send** -- the sender is blocked until the message is received
 - **Blocking receive** -- the receiver is blocked until a message is available
- **Non-blocking** is considered **asynchronous**
 - **Non-blocking send** -- the sender sends the message and continues
 - **Non-blocking receive** -- the receiver receives:
 - A valid message, or
 - Null message
- Different combinations possible
 - If both send and receive are blocking, we have a **rendezvous**

Operating System Concepts – 10th Edition

3.44

Silberschatz et al © 2018 updated by Khazaei @ 2021

44

Buffering

- Queue of messages attached to the link.
- Implemented in one of three ways
 1. Zero capacity – no messages are queued on a link.
Sender must wait for receiver (rendezvous)
 2. Bounded capacity – finite length of n messages
Sender must wait if link full
 3. Unbounded capacity – infinite length
Sender never waits

Silberschatz et al © 2018 updated by Khazaei @ 2021

48

Pipes

- Acts as a conduit allowing two processes to communicate
- Issues:
 - Is communication unidirectional or bidirectional?
 - In the case of two-way communication, is it half or full-duplex?
 - Must there exist a relationship (i.e., **parent-child**) between the communicating processes?
 - Can the pipes be used over a network?
- **Ordinary pipes** – cannot be accessed from outside the process that created it. Typically, a parent process creates a pipe and uses it to communicate with a child process that it created.
- **Named pipes** – can be accessed without a parent-child relationship.

Add WeChat powcoder

- Ordinary Pipes allow communication in standard producer-consumer style
- Producer writes to one end (the **write-end** of the pipe)
- Consumer reads from the other end (the **read-end** of the pipe)
- Ordinary pipes are therefore unidirectional
- Require parent-child relationship between communicating processes

- Windows calls these **anonymous pipes**

52

Named Pipes

- Named Pipes are more powerful than ordinary pipes
- Communication is bidirectional
- No parent-child relationship is necessary between the communicating processes
- Several processes can use the named pipe for communication
- Provided on both UNIX and Windows systems

Add WeChat powcoder Communications in Client-Server Systems

- Sockets
- Remote Procedure Calls

Operating System Concepts – 10th Edition

3.54

Silberschatz et al © 2018 updated by Khazaei @ 2021

54

Sockets

- A **socket** is defined as an endpoint for communication
- Concatenation of IP address and **port** – a number included at start of message packet to differentiate network services on a host
- The socket **161.25.19.8:1625** refers to port **1625** on host **161.25.19.8**
- Communication consists between a pair of sockets
- All ports below 1024 are **well known**, used for standard services
- Special IP address 127.0.0.1 (**loopback**) to refer to system on which process is running

Sockets in Java

- Three types of sockets
 - **Connection-oriented (TCP)**
 - **Connectionless (UDP)**
 - ▶ **MulticastSocket**
class— data can be sent to multiple recipients
- Consider this “Date” server in Java:

```
import java.net.*;
import java.io.*;

public class DateServer
{
    public static void main(String[] args) {
        try {
            ServerSocket sock = new ServerSocket(6013);

            /* now listen for connections */
            while (true) {
                Socket client = sock.accept();

                PrintWriter pout = new
                    PrintWriter(client.getOutputStream(), true);

                /* write the Date to the socket */
                pout.println(new java.util.Date().toString());

                /* close the socket and resume */
                /* listening for connections */
                client.close();
            }
        } catch (IOException ioe) {
            System.err.println(ioe);
        }
    }
}
```

Add WeChat Sockets in Java

The equivalent Date client

```
import java.net.*;
import java.io.*;

public class DateClient
{
    public static void main(String[] args) {
        try {
            /* make connection to server socket */
            Socket sock = new Socket("127.0.0.1",6013);

            InputStream in = sock.getInputStream();
            BufferedReader bin = new
                BufferedReader(new InputStreamReader(in));

            /* read the date from the socket */
            String line;
            while ( (line = bin.readLine()) != null)
                System.out.println(line);

            /* close the socket connection*/
            sock.close();
        } catch (IOException ioe) {
            System.err.println(ioe);
        }
    }
}
```

58

Remote Procedure Calls

- Remote procedure call (RPC) abstracts procedure calls between processes on networked systems
 - Again uses ports for service differentiation
- **Stubs** – client-side proxy for the actual procedure on the server
- The client-side stub locates the server and **marshalls** the parameters
- The server-side stub receives this message, unpacks the marshalled parameters, and performs the procedure on the server
- On Windows, stub code compile from specification written in **Microsoft Interface Definition Language (MIDL)**

Add WeChat powcoder Remote Procedure Calls (cont.)

- Data representation handled via **External Data Representation (XDR)** format to account for different architectures
 - **Big-endian** and **little-endian**
- Remote communication has more failure scenarios than local
 - Messages can be delivered **exactly once** rather than **at most once**
- OS typically provides a rendezvous (or **matchmaker**) service to connect client and server
 - Why do we need a matchmaker?
